## **Clinical Process Instruction Manual**

### **Multi-Tissue Recovery Records Process Instruction**

#### Policy:

Each tissue banking organization, including recovery partners, is required to provide detailed documentation of the tissue banking processes for which the organization is responsible. Documentation must be made concurrent with each significant step of the recovery process, and for Trillium Gift of Life Network (TGLN) recovery services. This includes but is not limited to: donor suitability assessment, donor identification, tissue recovery, donor and tissue transport, record review and tissue labelling.

Records shall document the responsible parties and must delineate the dates, times, and locations of procedures, as well as the individuals performing them, in order to facilitate traceability. All records are considered confidential and are kept in a location with controlled access; precautions for the safety and security of records should be in place and self-evident.

The Lead Multi Tissue Recovery Coordinator (MTRC) is responsible for ensuring specific documentation components of the recovery processes are complete, however, all MTRCs involved in documentation are responsible for ensuring correctness and accuracy of the data. The MTRC documenting the tissue recovery is assigned the circulator role during the recovery.

#### **Process:**

- Any trained recovery personnel may complete the tissue recovery documentation. The assigned circulator is accountable for the accuracy and completeness of the information they enter into the tissue recovery form or iTransplant. The Lead MTRC is responsible for reviewing the documentation recorded in the tissue recovery form or iTransplant in the following areas: chart review, physical assessment and deviations for completeness.
- 2. The circulator is responsible for informing the Lead of any red flags, discrepancies or challenges pertaining to the donor's chart review, donor refrigeration, physical assessment, donor weight, etc.
- 3. The MTRC shall bring the recovery laptop, scanner and hardcopies of the *Consent Form to Donate Organs and Tissues* and all pertinent donor screening documents from iTransplant to ensure the availability of all records in the event that iTransplant is not accessible due to poor or no internet connection.
- 4. Documentation of recovery processes shall be completed in iTransplant, the donor management system wherever possible.
- 5. Only in cases where there is no electronic access to donor records may recovery documentation be documented on the paper backup record (i.e., the *Multi Tissue Recovery Form*). See Exhibit 1.

### **Clinical Process Instruction Manual**

### **Multi-Tissue Recovery Records Process Instruction**

- 5.1 If paper documentation is required, the rationale shall be documented in the clinical notes so that any pertinent follow up can be performed.
- 5.2 Once completed, the paper record shall be scanned into the donor chart and a transcription of the information from the paper record into the electronic record be made.
- 6. Records for tissue recovery shall include the following:
  - name and address of the recovery agency;
  - date, time and staff involved in the recovery process;
  - location and assessment of the suitability of the recovery site;
  - donor, name, age, and sex;
  - type, lot number, manufacturer, and expiration date of supplies and reagents used to recover, rinse, and transport tissue;
  - specific tissue recovered;
  - ABO/Rh if available;
  - date and time of asystole;
  - date and time of recovery of the heart (time when subjected to cold rinse solution)

For a complete list of every required field, reference the iTransplant Recovery User Manual.

7. Additionally, TGLN shall provide a record of the tissue recovered, date of recovery, name and address of the recovery agency, and name of the donor to the recovery site facility by completing the *Multi-Tissue Recovery Note*. See Exhibit 2.
